

Unit 1: Introduction to Python and Github

Case Study:

*In this lecture we will “download”, edit, and “submit” a **Jupyter notebook** to and from **Github repositories** located on our STAT207 Github Enterprise organization.*

Purpose of this Lecture:

In this lecture we will cover the following topics.

1. Overview of data science software and platforms we will use.
2. What is **version control** and why use a **version control system**, like **Git**?
3. What is a **Git repository**?
4. What is a **branch** in a Git repository?
5. What is **Github**?
6. What is a **Github Enterprise Organization**?
7. Exploring the repositories on our **STAT207 Github Enterprise Organization**
8. How to “initially download” (ie. **clone**) a virtual repository to your local computer.
9. How to “download” files/folders (or updates to files/folders) (ie. **fetch** and **merge**) from a virtual repository to a local repository on your computer.
10. What is a **Jupyter notebook** and how do you use and edit one?
11. How to “submit” materials from your local computer to your private netid remote repository on Github.

Additional resources: <https://www.javatpoint.com/git>

STAT107 Review about Git: <https://discovery.cs.illinois.edu/learn/Basics-of-Data-Science-with-Python/Software-Version-Control-with-git/>

1. Overview of data science software and platforms we will use.

The instructions in your first lab <http://courses.las.illinois.edu/fall2022/stat207/labs/01-intro.html>

will tell you how to download and get familiar with each of these software and platforms.

Main Purpose in Class	Software/Platform	What is it?
Coding Lab Assignments in Python	Anaconda	Distribution of the Python and R programming languages. Allows you to download and run popular Python packages and the <u>Jupyter Notebook Application</u> .
	Jupyter Notebooks	Python application that allows you to <u>write data science reports</u> that also need to be integrated with interactive Python code blocks.
	Python	A programming language
Version Control: practice of tracking and managing changes to code.	Git	Version control system .
	Github	Git repository hosting service .
	Github Enterprise STAT207 Organization	A collection of user accounts (users=you, your classmates, Dr. Ellison, TAs, and Cas) that owns Github repositories .
	Command Line Interface	An application that processes commands to a computer program in lines of text.

WHAT IS **VERSION CONTROL** AND WHY USE A **VERSION CONTROL SYSTEM** LIKE **Git**?

Version control is a class of _____ responsible for managing _____ to computer programs, documents, large web sites, or other collections of information.

Git is an open-source distributed version control system.

Working in Groups

Initial Version of Notebook

Student 1 downloads and makes edits to this notebook

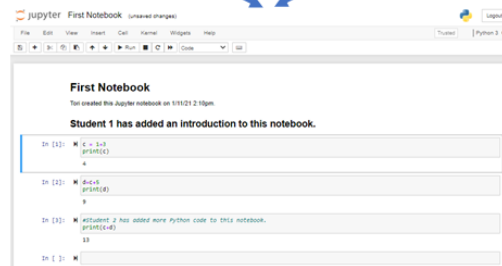

Student 2 downloads and makes edits to this notebook

Git

Edits from Students 1 and 2 have been automatically combined

Tracking changes and being able to revert back to old versions

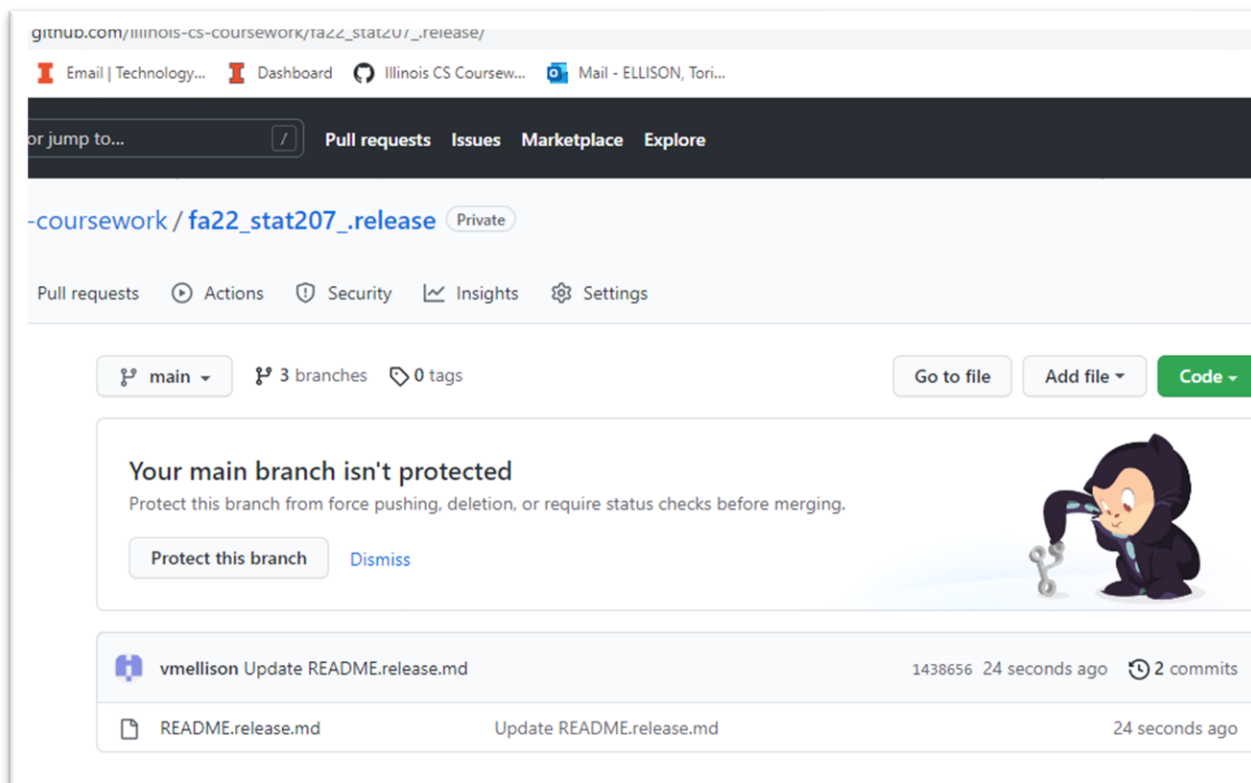

<https://opensource.com/article/18/6/git-reset-revert-rebase-commands>

WHAT IS A GIT REPOSITORY?

A git **repository** is a collection of _____ as well as a history of _____ made to these files and subfiles. You can think of a repository as a _____

Example of a Git Repository:

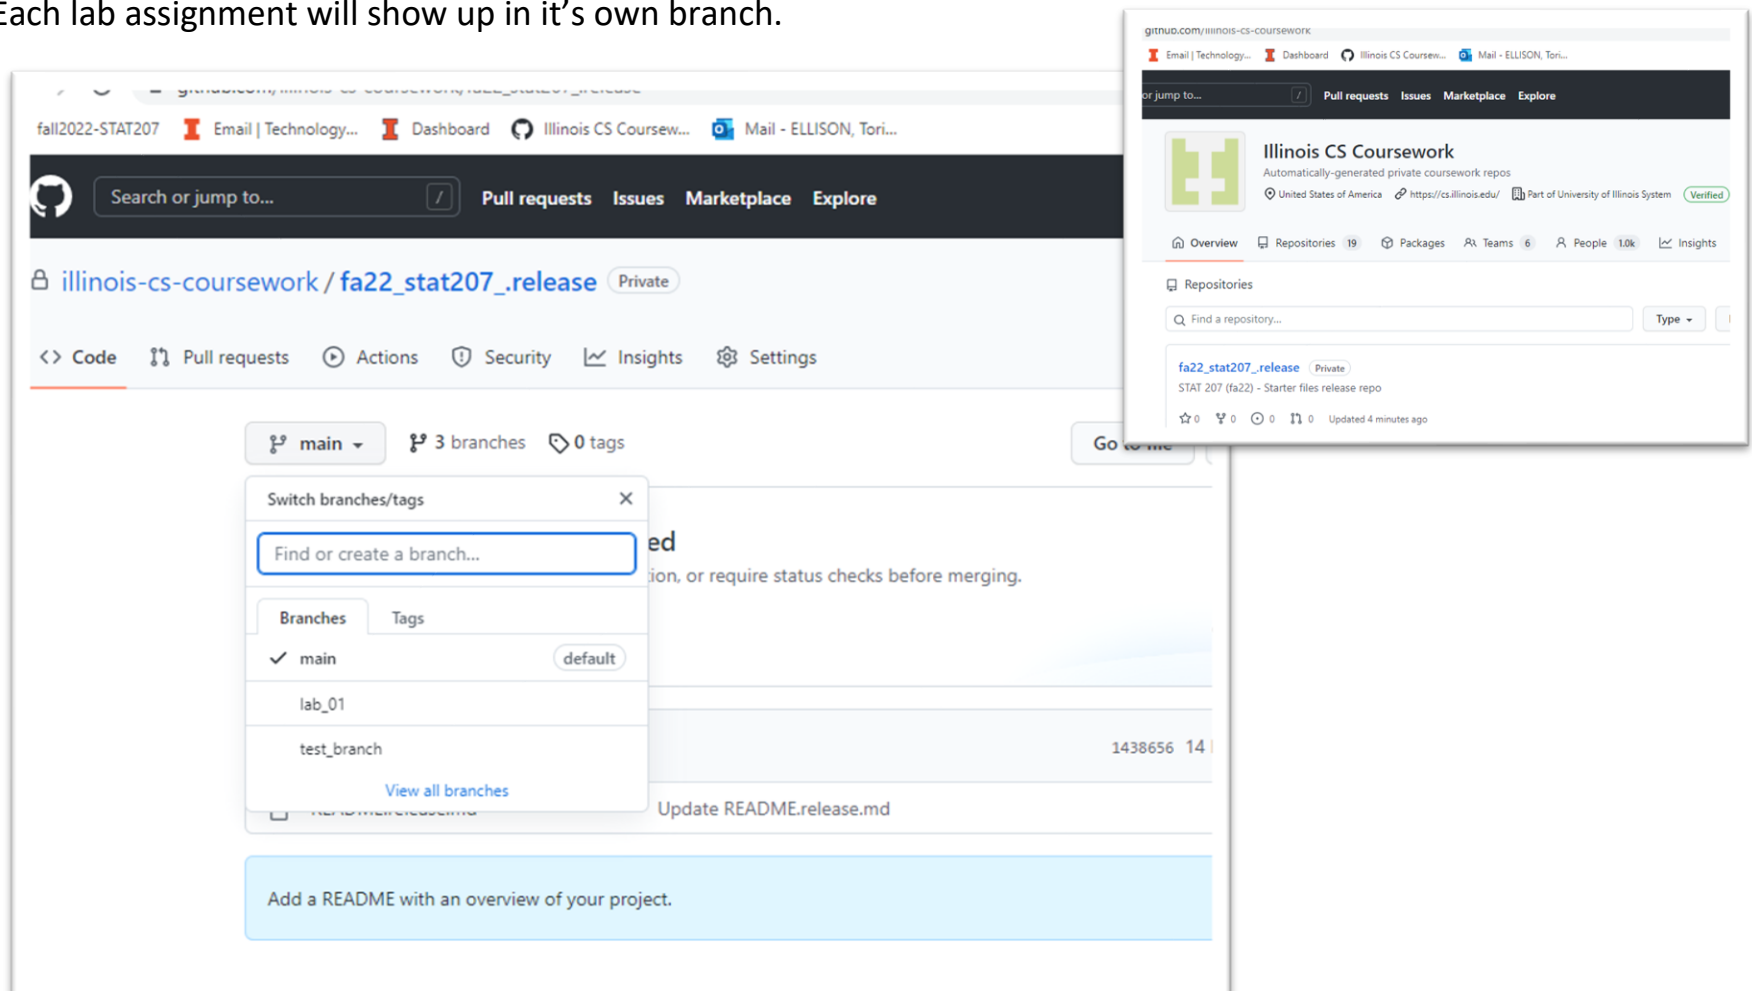

The *_release repository*, found here https://github.com/illinois-cs-coursework/fa22_stat207_.release, will contain the materials that you need to “download” to work on the lab assignments in this class.

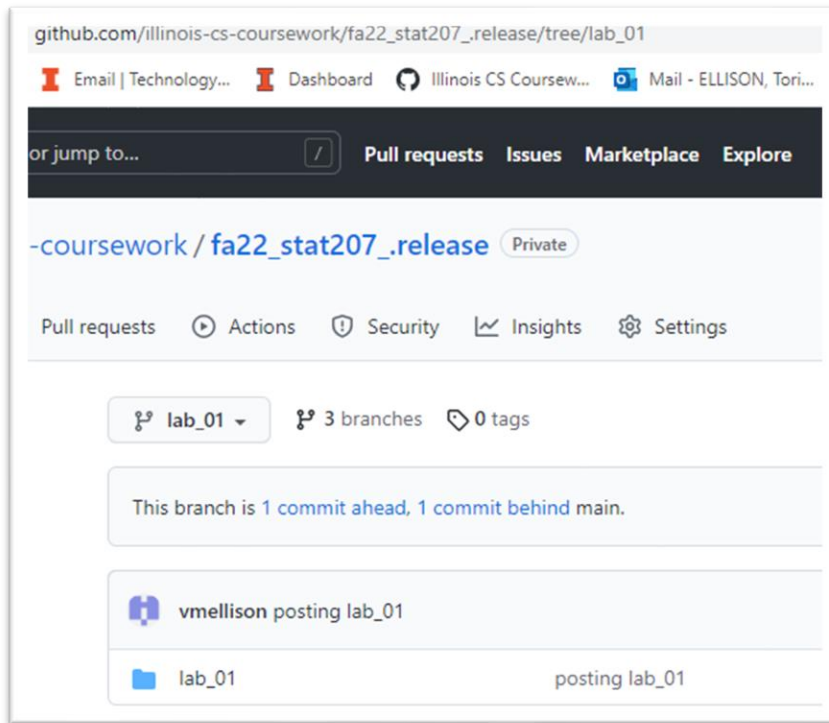

WHAT IS A GIT REPOSITORY **BRANCH**?

A git repository **branch** is a _____ of the repository that diverges from the main working project. You can think of a git repository branch as a _____.

Example: Check out the branches we have so far in the https://github.com/illinois-cs-coursework/fa22_stat207_.release repository. Each lab assignment will show up in it's own branch.

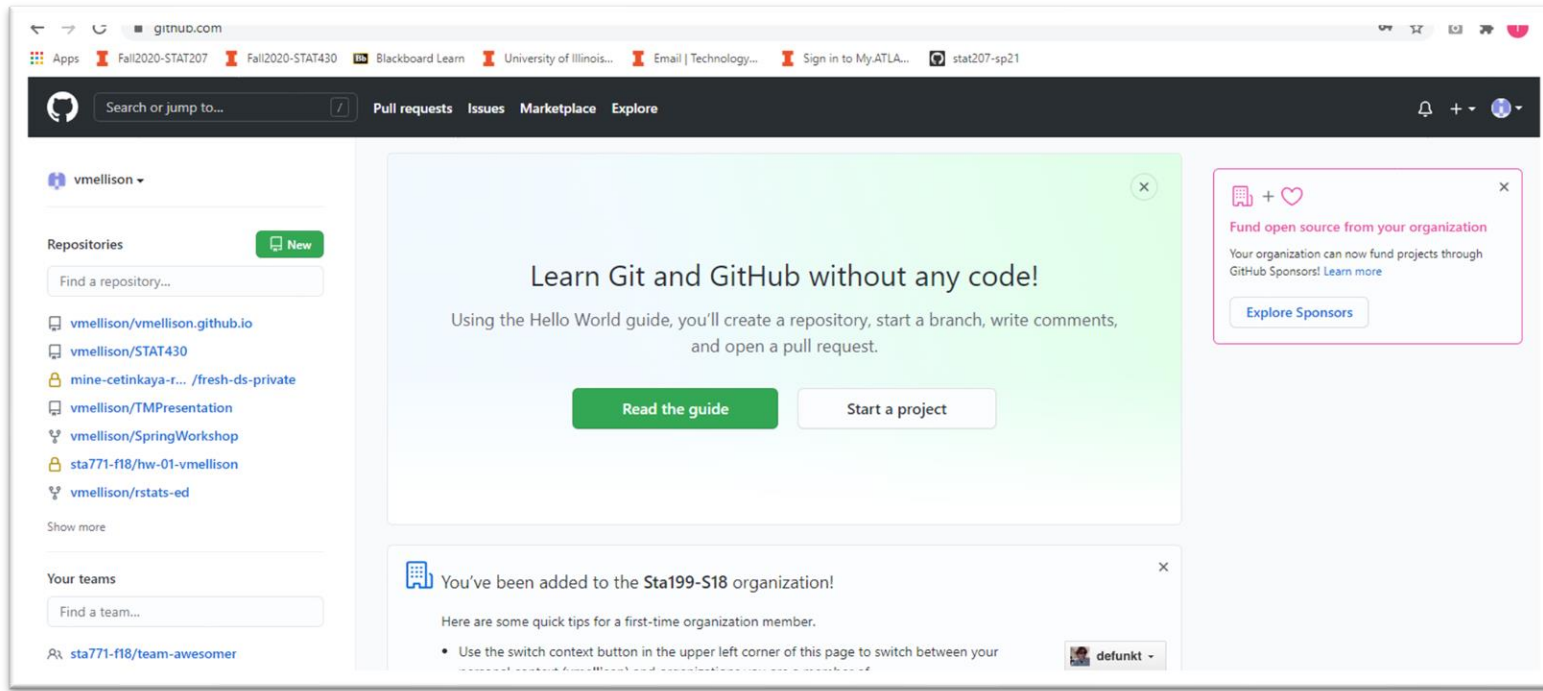

Example: Notice how the lab_01 has different files in it than the main branch. The main branch is the default, and Git will assume that this is the branch you are referring to unless you specify otherwise.

WHAT IS GITHUB?

GitHub is a web-based service that hosts _____.

WHAT IS A GITHUB ENTERPRISE ORGANIZATION?

A **Github Enterprise Organization** is a set of shared accounts and repositories, that is managed by owners and administrators.

For example: You can find the UIUC Coursework Github Enterprise organization here: <https://github.com/illinois-cs-coursework>

Below is an example of what students will see (after you have clicked https://edu.cs.illinois.edu/create-gh-repo/fa22_stat207/ to create your **private netid repository** in the UIUC Coursework Github Enterprise organization).

The screenshot shows the GitHub web interface for the 'Illinois CS Coursework' organization. The header includes the GitHub logo, the organization name, and a description: 'Automatically-generated private coursework repos'. Below this, there are tabs for 'Overview', 'Repositories' (19), 'Packages', 'Teams' (6), 'People' (1.0k), 'Insights', and 'Security'. The 'Repositories' tab is selected, showing a list of repositories. The first repository is 'fa22_stat207_vellison', which is private and a Jupyter Notebook. The second repository is 'fa22_stat207_release', which is private and contains starter files. Both repositories are updated now or 13 minutes ago.

EXPLORING THE REPOSITORIES ON OUR UIUC COURSEWORK GITHUB ENTERPRISE ORGANIZATION

How do these two class repositories work and what will they be used for?

Note: Your private netid repository starts out with just one branch: **main** (ie. the default). To keep things easier in this class, you should probably not try to create additional branches in your netid repository. The TAs will be looking in your **main branch** for your lab assignment submissions.

HOW TO “INITIALLY DOWNLOAD” (IE. **CLONE**) A VIRTUAL REPOSITORY TO YOUR LOCAL COMPUTER.

In general:

To make a copy of a repository on your local computer you can use

git clone <insert repository link> <insert “nickname” for repository>

in the command line in the folder you would like to store it in.

Example: Clone your *netid* repository

The instructions in your first lab assignment will discuss this in more detail (<http://courses.las.illinois.edu/fall2022/stat207/git.html>).

Local folder

You will edit and download your STAT207 materials in this folder on your local computer here.

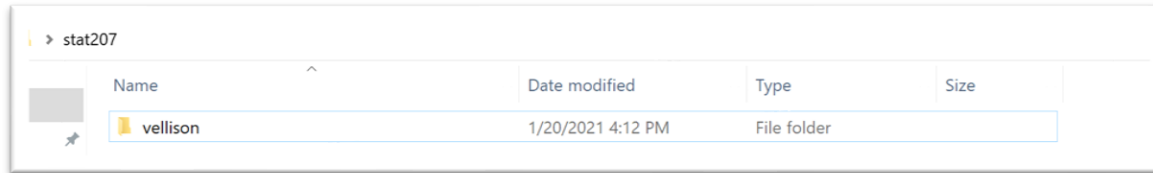

In Command Line...

Git CMD

```
c:\Users\vellison>cd desktop
c:\Users\vellison\Desktop>cd stat207
c:\Users\vellison\Desktop\stat207>git clone https://github.com/illinois-cs-coursework/fa22_stat207_vellison vellison
```

After running the command...

The screenshot shows a file explorer window with the address bar displaying '> stat207'. Below the address bar is a table with columns: Name, Date modified, Type, and Size. A single row is visible, representing a folder named 'vellison'. The 'Date modified' column shows '1/20/2021 4:12 PM' and the 'Type' column shows 'File folder'. The 'Size' column is empty. A small icon of a folder is visible to the left of the 'vellison' name.

Name	Date modified	Type	Size
vellison	1/20/2021 4:12 PM	File folder	

Whatever was in your *netid repository* (ie. nothing if you just created it) will show up in this folder named with your netid.

CREATING A NICKNAME FOR ANOTHER REPOSITORY

The instructions in your first lab assignment will discuss this in more detail (<http://courses.las.illinois.edu/fall2022/stat207/git.html>).

In Command Line...

```
C:\Users\vellison\Desktop\stat207>cd vellison  
C:\Users\vellison\Desktop\stat207\vellison>git remote add release https://github.com/illinois-cs-coursework/fa22_stat207_.release.git
```

Once you are in the cloned local repository, the

git remote add <insert nickname> <insert organization link>/<repo_name>.git

command creates a nickname for the specified repository.

HOW TO “DOWNLOAD” FILES/FOLDERS OR UPDATES TO FILES/FOLDERS (IE. **FETCH** AND **MERGE**) FROM A VIRTUAL REPOSITORY TO YOUR LOCAL REPOSITORY ON YOUR COMPUTER.

General Commands: (these commands only work after you have **cloned** a repository and your git command line is in that repository).

- **git fetch** <insert repository name>
 - Transmits the *“whole version” of the REMOTE repository* to your LOCAL computer.
- **git merge** <insert repository name>/<insert branch name> -m “notes about merge”
 - Merges just the *changes made to the specified branch of the remote repository*.

For example: In the command line code below we **fetch** the virtual **_release repository**. And then we **merge** the following:

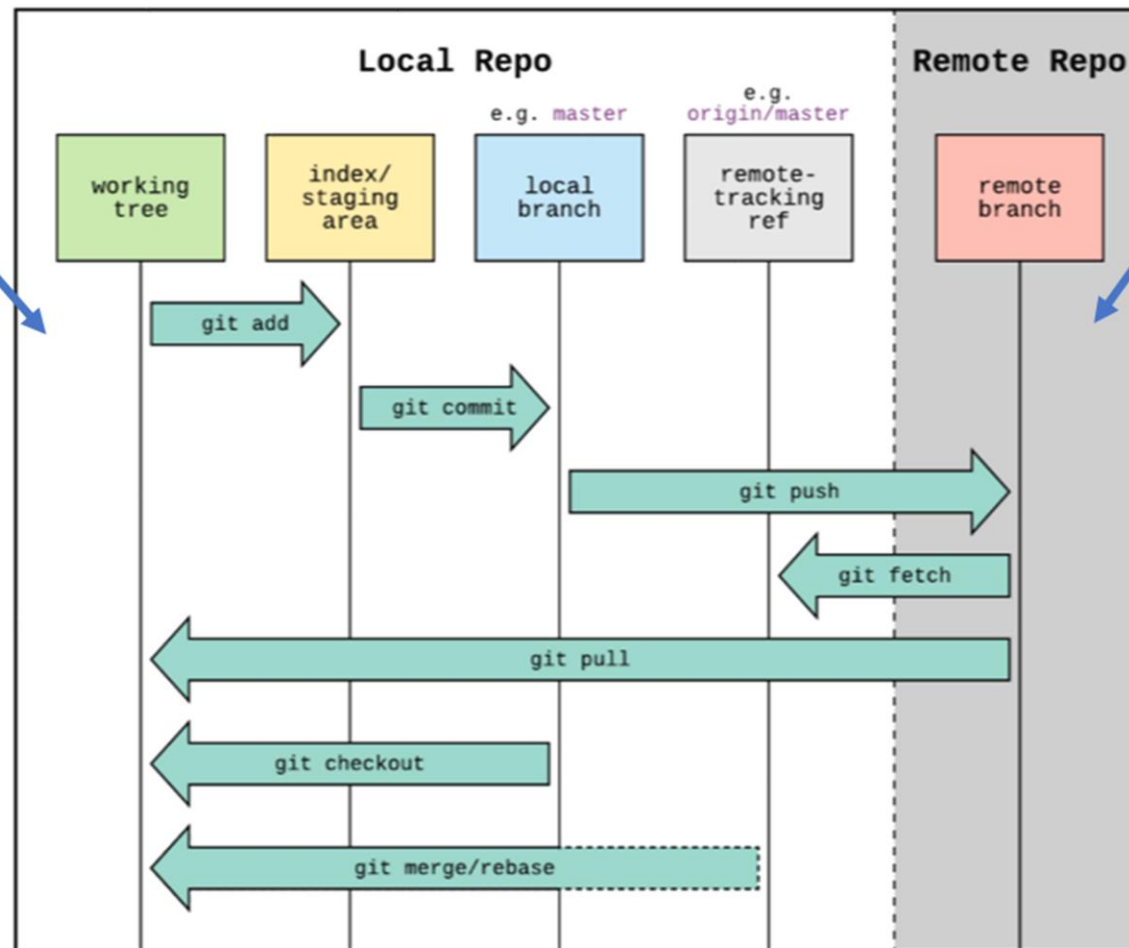

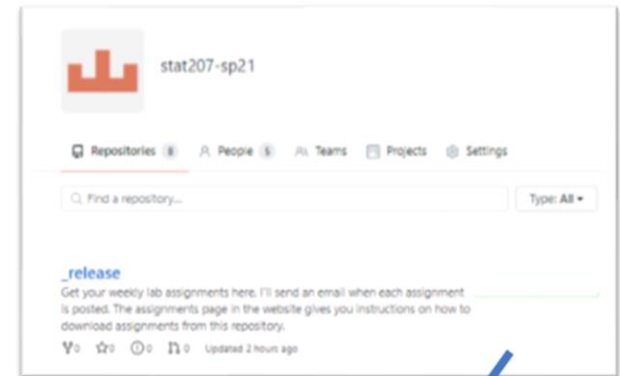

- what is in the demo_branch branch of the virtual _release repository
- what is in the main branch of your local netid repository.

These changes will show up in the folder that your local netid repository resides in.

Git CMD

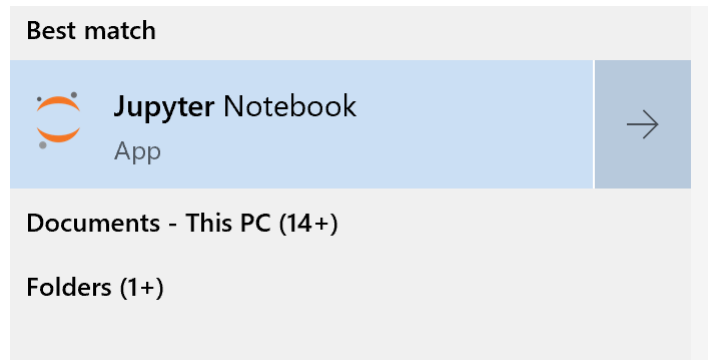

```
C:\Users\vellison>cd desktop
C:\Users\vellison\Desktop>cd stat207
C:\Users\vellison\Desktop\stat207>cd vellison
C:\Users\vellison\Desktop\stat207\vellison>git fetch release
remote: Enumerating objects: 20, done.
remote: Counting objects: 100% (20/20), done.
remote: Compressing objects: 100% (14/14), done.
remote: Total 20 (delta 4), reused 5 (delta 1), pack-reused 0
Unpacking objects: 100% (20/20), 2.75 KiB | 8.00 KiB/s, done.
From https://github-dev.cs.illinois.edu/stat207-sp21/_release
* [new branch]      demo_branch -> release/demo_branch
* [new branch]      lab_01      -> release/lab_01
* [new branch]      master      -> release/master
C:\Users\vellison\Desktop\stat207\vellison>git merge release/demo_branch -m "Merging initial files"
C:\Users\vellison\Desktop\stat207\vellison>
```

What shows up in this local folder will be a **merging** of what is in the **remote demo branch** of the **_release repository** and whatever you currently have in your **local copy of your netid repository** (most likely **master branch**)

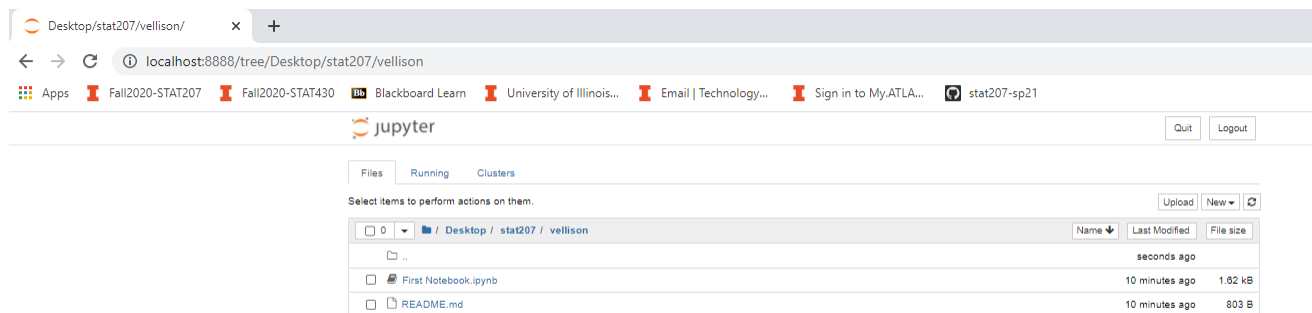

WHAT IS A JUPYTER NOTEBOOK AND HOW DO YOU USE AND EDIT ONE?

1. First, check out the instructions in your first lab <http://courses.las.illinois.edu/fall2022/stat207/labs/01-intro.html> for how to download **minicondas** software which contains the **Jupyter notebook application**.
2. Start your **Jupyter notebook application**

3. This will open a browser which displays your computer's file system. Use this file system display like you would on your computer to navigate to the folder on computer where your recently downloaded **Jupyter notebook (.ipynb)** is located. Click on the file in this screen to open and edit the notebook.

HOW TO “SUBMIT” MATERIALS (OR CHANGES TO MATERIALS) FROM YOUR LOCAL COMPUTER BACK TO A REPOSITORY.

In general

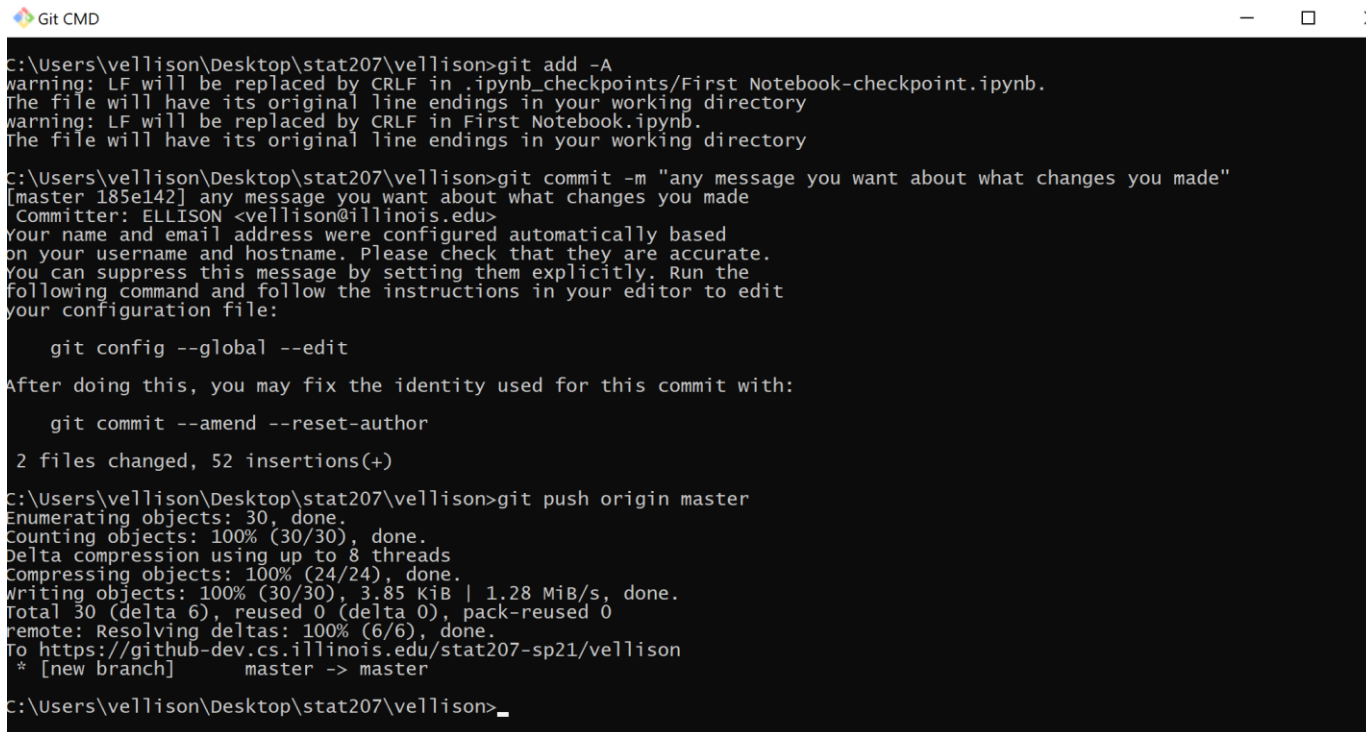

Commands:

- **git add -A**
 - Adds your changes to the **index/staging area** (this is a “rough draft space.”)
- **git commit -m “message explaining your changes”**
 - Adds a “snapshot of your project” (with changes) to the local branch along with your message.
- **git push origin master**
 - Pushes/overwrites these changes you made back to the REMOTE repository.

Example: Push your local changes back to your remote netid repository.

Your first lab <http://courses.las.illinois.edu/fall2022/stat207/labs/01-intro.html> talks about how to do this in more detail.

```
Git CMD
c:\Users\vellison\Desktop\stat207\vellison>git add -A
warning: LF will be replaced by CRLF in .ipynb_checkpoints/First Notebook-checkpoint.ipynb.
The file will have its original line endings in your working directory
